

Product Requirements Document (PRD)

Pizza Shop Online Ordering Website

Document Type	Product Requirements Document (PRD)
Product	Pizza Shop Ordering Website
Version	v1.0 (Draft)
Status	For Review
Prepared For	Pizza Shop Client

1. Introduction

1.1 Purpose

This document defines the product requirements for a single-location pizza shop's online ordering website. It describes what the product does, who uses it, and what each user role can and cannot do. This is a **business/product-focused** document (PRD) — it defines *what* to build and *why*, not the technical architecture (that would be a separate SRS/technical spec).

1.2 Intended Audience

Client (business owner), designers, and the development team responsible for building the website.

1.3 Background

The client currently runs a physical pizza shop and wants a **website** (not a mobile app) that allows customers to order pizza online, track their order status, and leave reviews. The system also needs to manage inventory automatically, so ingredient stock stays accurate as orders come in, without manual daily reconciliation.

2. Product Overview

A single website serving **three distinct roles**:

Role	Who	Primary Purpose
Customer (User)	General public	Browse menu, order pizza, pay, track order, leave reviews
Manager	Shop's inventory manager (1 account)	Add incoming raw material stock, monitor sales vs. inventory usage

Admin	Shop owner/administrator (1 account)	Manage menu items, view orders and sales reports, view (read-only) inventory levels
--------------	--------------------------------------	---

The system also runs an **automated inventory engine** in the background: every pizza sold deducts the exact ingredient quantities defined in its recipe from stock, without any manual entry.

3. Scope

3.1 In Scope (v1)

- Customer-facing website: browse menu, order, pay, track, review
- Guest checkout and optional account creation
- Delivery and pickup fulfillment
- Cash payment (on delivery or at pickup) — no online payment gateway in v1
- Order cancellation within a short window
- Simple order status tracking (no live GPS tracking)
- Menu item reviews and order/delivery experience reviews
- Manager panel: add stock
- Admin panel: manage menu, view orders, view sales reports, view inventory (read-only)
- Automatic recipe-based inventory deduction on every sale
- Low-stock alerts
- Auto "Sold Out" tagging when an ingredient depletes

3.2 Out of Scope (v1)

Explicitly excluded from this version, to keep scope controlled:

- Mobile app (website only)
- Full pizza customization/builder (only pizza + size selection)
- Multiple shop branches/locations
- Multiple staff accounts under Admin or Manager (single account each)
- Discounts, promo codes, or combo deals
- Email/SMS order notifications (status shown on website only)
- Any wallet or stored-balance payment system
- Online payment gateway (card/wallet) — v1 is cash-only; a gateway can be added later without changing the rest of the system
- In-app recipe/BOM management UI (recipe is configured at the backend/database level by the developer)
- Live GPS/map-based delivery tracking

These are candidates for future versions — see **Section 9: Future Enhancements**.

4. User Roles & Personas

4.1 Customer

Someone who wants to order pizza for delivery or pickup, with minimal friction (no forced account creation), and wants to know the status of their order without calling the shop.

4.2 Manager

Responsible for physical stock. Receives raw material deliveries (chicken, cheese, yeast, etc.) and logs them into the system. Also reviews sales data to cross-check against inventory consumption, in order to catch discrepancies (waste, theft, or errors).

4.3 Admin

The shop owner or designated administrator. Manages what's on the menu, monitors order volume and revenue over time, and keeps an eye on stock levels — without being able to alter them directly (that responsibility stays with the Manager).

5. Functional Requirements

5.1 Customer — Ordering

- **FR-1.1:** Customer can browse the pizza menu (name, description, price, image, size options)
- **FR-1.2:** Customer can select a pizza and a size (no further topping/base customization in v1)
- **FR-1.3:** Customer can add multiple items to a cart, view/edit cart before checkout
- **FR-1.4:** Customer can check out as a guest or as a logged-in account holder
- **FR-1.5:** Customer chooses fulfillment method: Delivery or Pickup
- **FR-1.6:** Customer can add optional special instructions per order (e.g., "no onions")
- **FR-1.7:** If a pizza's required ingredient is unavailable, it is automatically shown as "Sold Out" and cannot be added to cart

5.2 Customer — Payment

- **FR-2.1:** Customer pays cash, either on delivery or at pickup — no online payment in v1
- **FR-2.2:** Order confirmation is shown immediately after order placement (no payment step to wait on)

5.3 Customer — Order Tracking & Cancellation

- **FR-3.1:** Customer can view real-time order status on the website: Placed → Preparing → Out for Delivery / Ready for Pickup → Delivered / Picked Up
- **FR-3.2:** No email/SMS notifications in v1 — status is visible only when the customer checks the website/tracking page
- **FR-3.3:** Customer can cancel an order within a short, defined window (before status moves to "Preparing")

- **FR-3.4:** Logged-in customers can view their past order history; guests can track only their current/active order (e.g., via a tracking link)

5.4 Customer — Reviews

- **FR-4.1:** Customer can leave a rating/review on individual menu items (pizzas)
- **FR-4.2:** Customer can leave a rating/review on the overall order/delivery experience
- **FR-4.3:** Reviews are visible to other customers on the relevant menu item page

5.5 Inventory Engine (System-Wide, Automated)

- **FR-5.1:** Each pizza (per size) has a defined recipe/BOM — a fixed quantity of each raw ingredient it consumes (e.g., 1 medium chicken pizza = 200g chicken + 150g cheese + 20g yeast)
- **FR-5.2:** Recipes are configured at the backend/database level by the developer (no in-app UI in v1), but must be structured so they can be updated later if ingredients or quantities change, without requiring a full system rebuild
- **FR-5.3:** Every completed sale automatically deducts the corresponding ingredient quantities from current stock
- **FR-5.4:** When an ingredient's stock crosses a defined low-stock threshold, the system triggers an alert (visible to Manager and/or Admin)
- **FR-5.5:** When an ingredient's stock reaches zero, any pizza requiring that ingredient is automatically marked "Sold Out" on the customer-facing menu — no manual action needed

5.6 Manager Panel

- **FR-6.1:** Manager can log in to a dedicated Manager view
- **FR-6.2:** Manager can add newly received stock for any ingredient (e.g., "+10kg chicken")
- **FR-6.3:** Manager can view current stock levels for all ingredients
- **FR-6.4:** Manager can view sales reports (orders and revenue) to cross-check against inventory usage
- **FR-6.5:** Manager **cannot** edit the menu or view/change Admin-only settings

5.7 Admin Panel

- **FR-7.1:** Admin can log in to a dedicated Admin view
- **FR-7.2:** Admin can add, edit, or remove menu items (name, description, price, size options, image, availability)
- **FR-7.3:** Admin can view the number of current/active orders
- **FR-7.4:** Admin can view sales reports: **daily, monthly, and yearly**
- **FR-7.5:** Admin can view current inventory levels for all ingredients (**read-only** — cannot add or adjust stock)
- **FR-7.6:** Admin **cannot** add or modify stock quantities (that is Manager-only)

6. User Stories

Customer

- As a customer, I want to browse the pizza menu without creating an account, so I can decide quickly what to order.
- As a customer, I want to check out as a guest, so ordering is fast if I don't want to sign up.
- As a customer, I want to choose delivery or pickup, so I can pick whatever's convenient.
- As a customer, I want to pay with cash on delivery or pickup, so checkout is simple and I don't need a card.
- As a customer, I want to see my order's current status on the website, so I know when to expect it.
- As a customer, I want to cancel my order shortly after placing it, in case I change my mind or made a mistake.
- As a customer, I want to leave a review on a pizza I ordered, so I can share feedback with others.
- As a customer, I want to leave a review on my overall delivery experience, so the shop can improve service.
- As a customer, I want to see if a pizza is sold out before I try to order it, so I'm not disappointed later.

Manager

- As a manager, I want to log new stock I've received, so inventory stays accurate.
- As a manager, I want to see current stock levels, so I know what needs reordering.
- As a manager, I want to see sales data alongside inventory usage, so I can spot mismatches that suggest waste or fraud.
- As a manager, I want to be alerted when stock is running low, so I can reorder before running out.

Admin

- As an admin, I want to add or update menu items, so the website reflects what we currently offer.
- As an admin, I want to see how many orders are active right now, so I can gauge current shop load.
- As an admin, I want to see daily/monthly/yearly sales reports, so I can track business performance over time.
- As an admin, I want to view current inventory levels, so I have visibility without needing to manage stock myself.

7. Non-Functional Considerations (High-Level)

(Full technical detail belongs in an SRS — noted here only where it affects product decisions.)

- The website should be usable on both desktop and mobile browsers (responsive design), since it's web-only, not a native app.
- Inventory deductions must be accurate and consistent — a sale should never be confirmed without the corresponding stock deduction succeeding.
- The system should reasonably handle concurrent orders (e.g., two customers ordering the last available pizza at the same time) without overselling stock.

8. Assumptions & Constraints

- Single shop location; no multi-branch logic required.
- Single Admin account and single Manager account — no multi-user role management needed in v1.
- Recipe/BOM values are set once during development and only change if the client explicitly requests an ingredient/recipe update (handled at the backend level).
- No loyalty points, referral system, or stored-balance wallet in v1.
- The client will provide menu details, pricing, and ingredient recipe quantities before development begins.

9. Future Enhancements (Explicitly Out of Scope for v1)

Ideas discussed and intentionally deferred, to keep v1 scope tight:

- "Order Again" / reorder from order history
- Saved delivery addresses for account holders
- FAQ / Contact / Store hours page
- Menu search and filters (category, veg/non-veg, price)
- Auto-refreshing order tracking page
- Sort/filter on reviews (most recent, highest rated)
- Printable/downloadable order receipt
- "Popular/Recommended pizzas" section based on sales data
- Discounts, promo codes, combo deals
- Email/SMS order notifications
- In-app recipe/BOM management screen
- Multi-branch support
- Multiple staff accounts under Admin/Manager
- Wallet or stored-balance payment (store credit, saved payment method, or full prepaid wallet — all considered and deferred)
- Online payment gateway (card/wallet) — v1 is cash-only

10. Success Metrics (Suggested)

- % of orders completed without inventory-related errors (e.g., stock going negative)
- Average customer rating across reviews
- Order completion rate (carts started vs. orders placed)
- Reduction in manual stock-counting effort for the Manager (qualitative, post-launch feedback)

11. Open Questions

- What is the exact low-stock alert threshold per ingredient? (To be defined by client per ingredient.)
 - What is the exact cancellation window (e.g., 5 minutes / until "Preparing" starts)? (To be finalized with client.)
-
